## **Claims**

A capacitive touch pad comprising first and second layers, [1] the first layer comprising a non-conductive cover providing galvanic isolation of the second layer, the second layer comprising a plurality of row-shaped row-sensing electrodes and a row-by-column array of column-sensing electrodes, each column of column-sensing electrodes interconnected by conductive traces, the row-sensing electrodes and column-sensing electrodes defining interleaved combs therebetween, each comb comprising at least two fingers. The capacitive touch pad of claim 1 wherein the fingers are no wider than eight [2] mils. The capacitive touch pad of claim 1 wherein the fingers define spaces [3] therebetween, and the spaces are no wider than eight mils. The capacitive touch pad of claim 1 further comprising a third layer, the second [4] layer lying between the first and third layers, the third layer comprising a ground plane. The capacitive touch pad of claim 4 further comprising a fourth layer, the third [5] layer lying between the second and fourth layers, the fourth layer bearing circuitry. The capacitive touch pad of claim 1 wherein in the second layer further [6] comprises annular copper around the electrodes. The capacitive touch pad of claim 6 wherein the annular copper is connected to [7] ground potential. The capacitive touch pad of claim 1 further comprising an isolator/dielectric [8] layer between the first and second layers. The capacitive touch pad of claim 4 further comprising an isolator/dielectric [9] layer between the second and third layers. The capacitive touch pad of claim 5 further comprising an isolator/dielectric [10] layer between the third and fourth layers.
